

gentstereo repeat is a remote cable release to trigger multiple Canon Cameras running the SDM software enhancement. For details see stereo.jpn.org/eng/sdm/index.htm

gentstereo repeat is used as an accessory to **gentstereo pro** when more than 2 cameras are to be triggered together.

Connect the two units together using a mono or stereo 3.5mm to 3.5mm jack lead between the AUX connector on PRO to any one of the connectors on REPEAT. Ensure the link inside the PRO is in the U position to configure AUX for USB output.

Now, all 10 ports on the REPEAT will work with the 2 USB ports on the PRO. Multiple REPEAT modules can be daisy-chained together with additional 3.5mm jack leads to trigger more than 12 cameras.

Diagnostics

Are the cameras properly configured for SDM, and on the list of supported cameras? The SD card should be *locked*.
Check the batteries are correctly inserted and not exhausted.

Regulatory

This module has been assessed and tested for safety and EMC. It is supplied without a case to allow users to configure it to meet their multi-camera photography needs.

At the end of the products life, you have the right to return it (freight at your expense) for disposal according to the WEEE Directive.
